# Why We Need Nuclear Power: The Environmental Case

## Synopsis

Nuclear power may just be the most important solution to our search for clean, sustainable energy sources. Although wind and solar can contribute to our energy mix, we need a reliable source to meet large-scale energy demands and break our dependence on fossil fuels. However, most people are wary, if not downright afraid, of nuclear power. Given nuclear disasters such as Chernobyl and Fukushima, it's not difficult to see why. In the wake of these events, fear has clouded the public's understanding of the facts. It's time to clear up those misconceptions and examine the science behind nuclear power, in order to determine what role it could and should play in our future. In *Why We Need Power: The Environmental Case*, radiation biologist Michael H. Fox argues that nuclear power is essential to slowing down the impact of global warming. He examines the issue from every angle, relying on thirty-five years of research spent studying the biological effects of radiation. Fox begins with the problem, carefully laying out how our current energy uses and projections for the future will affect greenhouse gases and global warming. The book then evaluates each major energy source and demonstrates the limits of renewable energy sources, concluding that nuclear power is the best solution to our environmental crisis. Fox then delves into nuclear power, looking at the effects of radiation, the potential for nuclear accidents, and the best methods to dispose of nuclear waste. By systematically analyzing each aspect of the nuclear issue, Fox clarifies which concerns have a scientific basis and which remain unsupported. His in-depth exploration of the facts persuasively demonstrates that nuclear power is critical to reducing the effects of energy production on the global climate. Written in an engaging and accessible style, *Why We Need Nuclear Power* is an invaluable resource for both general readers and scientists interested in the facts behind nuclear energy.

## Book Information

File Size: 9508 KB

Print Length: 320 pages

Publisher: Oxford University Press; 1 edition (March 3, 2014)

Publication Date: March 3, 2014

Sold by: Digital Services LLC

Language: English

ASIN: B00INW815I

Text-to-Speech: Enabled

X-Ray: Not Enabled

Word Wise: Enabled

Lending: Not Enabled

Enhanced Typesetting: Enabled

Best Sellers Rank: #955,314 Paid in Kindle Store (See Top 100 Paid in Kindle Store) #46

in Kindle Store > Kindle eBooks > Engineering & Transportation > Engineering > Nuclear #228

in Kindle Store > Kindle eBooks > Nonfiction > Science > Physics > Energy #260 in Books >

Engineering & Transportation > Engineering > Energy Production & Extraction > Nuclear

## Customer Reviews

This is a highly informative, clearly written, and thorough examination of all aspects of nuclear power. If you are a doubter (as I have been), here's an opportunity to answer just about every doubt you have. Even if the answers--which I find compelling--fail to convince you, you can't complain about a lack of substance. For example, roughly 2,000 words are devoted to the Fukushima accident alone, with details such as exactly how many Fukushima plant workers got what specific doses of radiation, and what were the immediate effects, what was found in the follow-up in 2013, and expected effects in the future. The Fukushima piece was part of a chapter entitled "About Those Accidents", dealing with Fukushima, Three Mile Island, and Chernobyl. That chapter is, in turn, one of four chapters in "Part Three: The Risks of Nuclear Power". The author, Emeritus Professor in the Department of Radiological Health Sciences at Colorado State University, with 35 years experience as a radiation biologist, is not one to treat nuclear power risks lightly. The completeness of Fox's understanding of radiation and biology is evidenced in the 68 pages of "Part Two: Radiation and Its Biological Effects", containing (1) a history of the discovery, exploration, and uses of radioactivity; (2) a short, elementary course in the relevant aspects of nuclear physics; (3) a detailed description of the effect of radiation on cells, to include the different types of damage to DNA and the mechanics of DNA self-repair mechanisms; (4) natural background radiation (some surprises here!
