The Peanut Allergy Epidemic: What's Causing It And How To Stop It

Synopsis

Why is the peanut allergy an epidemic that only seems to be found in Western cultures? Over four million people in the United States alone are affected by peanut allergies, while there are no reported cases in India, a country where peanuts are the primary ingredient in many baby food products. Where did this allergy come from, and does medicine play any kind of role in the phenomenon? After her own child had an anaphylactic reaction to peanut butter, historian Heather Fraser decided to discover the answers to these questions. In *The Peanut Allergy Epidemic*, Fraser delves into the history of this allergy, trying to understand why it largely develops in children and studying its relationship with social, medical, political, and economic factors. In an international overview of the subject, she compares the epidemic in the United States to sixteen other geographical locations, finding that in addition to the United States, in countries such as Canada, the UK, Australia, and Sweden there is a one in fifty chance that a child, especially a male, will develop a peanut allergy. Fraser also highlights alternative medicines and explores issues of vaccine safety and other food allergies, making his book a must-read for every parent, teacher, and health professional.

Have you ever wondered WHY there are so many kids with peanut allergies these days? Heather Fraser did after her child had an anaphylactic reaction to peanut butter. I've heard that a worried mom with a sick kid does better research than the FBI, and this book proves that point. WHY IS THAT?*****Ms. Fraser quickly points out that peanut allergy used to be a concern only

for Western countries “ why is that?She indicates that there was a sudden rise in the U.K., U.S., Canada and Australia around 1990, and it worsened through the 2000s “ why is that?The odds of a Western child developing a peanut allergy were 1 in 75 as of 2008 “ why is that?She also writes that the person most likely to develop a peanut allergy is a male born after about 1990 in said Western countries whose ability to detoxify had been challenged by environmental factors • “ why is that?She finds it difficult to accept, as do I, that “hundreds of thousands of children had become allergic to this one food in the space of just twenty years by ingestion alone.”You can’t blame it on genetics, as the overall rate would stay the same. Logically, there would have to be something in the environment (food, toxins, etc.) that’s triggering this rise.
